COGNIZANT · AZURE AI PLATFORM SERVICES

Agent Governance and Operations

Know every agent, see how it is used, and prove a safe stop before relying on it

Built on Microsoft Azure

The challenges we hear most often

Agents everywhere

Copilot Studio, Foundry, custom hosts and other clouds each hold agents.

Usage is unclear

An inventory does not show which agents are active, dormant or orphaned.

Stopping is not instant

Stopping a Foundry agent does not end runs already in progress.

Our approach

We configure Microsoft Agent 365, the Foundry Control Plane and Entra agent identities first, then add usage evidence and a stop path proven in a measured pilot, only where they fall short.

1 Assess coverage
Runtimes, licences, telemetry

→

2 Configure
Agent 365, Foundry Control Plane, Entra

→

3 Evidence
Join usage to deployment records

→

4 Prove the stop
Pilot with measured stop time

→

5 Operate
Reviews, drills, audit evidence

What you get

- Agent inventory with business and technical owners
- Usage status for every in-scope agent
- A stop-path pilot with measured stop time
- Audit-ready control matrix and evidence pack
- Dormant-agent review and retirement process

How we engage

Option	What it covers	Typical duration
Coverage assessment	Inventory and licence check	3 to 4 weeks
Configure and evidence	Native control plane set up	6 to 10 weeks
Stop-path pilot	Measured stop time per runtime	3 to 4 weeks

Note: Typical durations. Scope and price are agreed after a short assessment.

Built on Microsoft Azure

Configures Microsoft Agent 365, Foundry Control Plane, Entra Agent ID and Conditional Access for agents, Defender and Purview before any custom build.

Note: Preview features are used only in pilots. Production uses generally available services.

Suggested next steps

1. List your agent platforms, even roughly
2. Confirm Agent 365 or Microsoft 365 E7 position
3. Name who may stop and restart an agent
