COGNIZANT · AZURE AI PLATFORM SERVICES

AI Gateway Implementation

One governed path for every model and tool call

Built on Microsoft Azure

The challenges we hear most often

Direct calls with keys

Apps and agents call models and tools directly, often with shared keys.

No cost split

Model spend cannot be traced to teams or agents.

Tool sprawl

Agents reach tools through MCP servers nobody approved.

Our approach

We build an Azure API Management AI gateway with identity, limits, safety checks and routing, and an Azure API Center registry so only approved tools are reachable.

1 Readiness
Consumers, models, tools, network

→

2 Design
Policies, identity, routing

→

3 Build
Gateway, private network, registry

→

4 Test
Load, bypass and failover tests

→

5 Report
Token metrics and showback by team

What you get

- Authenticated, metered calls for every governed app
- Routing across reserved and pay-as-you-go capacity
- An approved list of tools and MCP servers
- Direct endpoints closed and tested
- Cost reports by team and agent

How we engage

Option	What it covers	Typical duration
Readiness assessment	Scope and plan	2 to 4 weeks
Build, one region	Gateway, policies, network	8 to 14 weeks
Add-ons	Tools, multi-region, chargeback	3 to 8 weeks each

Note: Typical durations. Scope and price are agreed after a short assessment.

Built on Microsoft Azure

Uses Azure API Management (generally available tiers for production) and Azure API Center for the tool and MCP server registry.

Note: Preview features are used only in pilots. Production uses generally available services.

Suggested next steps

1. List the apps and agents calling models today
2. Share the target region and network design
3. Agree the readiness assessment
